Base Definitions of Managed Objects for TN3270E Using SMiv2

Status of this Memo

This document specifies an Internet standards track protocol for the Internet community, and requests discussion and suggestions for improvements. Please refer to the current edition of the "Internet Official Protocol Standards" (STD 1) for the standardization state and status of this protocol. Distribution of this memo is unlimited.

Abstract

This memo defines a Management Information Base (MIB) for configuring and managing TN3270E servers. TN3270E, defined by RFC 2355 [19], refers to the enhancements made to the Telnet 3270 (TN3270) terminal emulation practices. Refer to RFC 1041 [18], STD 8, RFC 854 [16], and STD 31, RFC 860 [17] for a sample of what is meant by TN3270 practices.

The MIB defined by this memo provides generic support for both host and gateway TN3270E server implementations. A TN3270E server connects a Telnet client performing 3270 emulation to a target SNA host over both a client-side network (client to TN3270E server) and an SNA Network (TN3270E server to target SNA host). The client-side network is typically TCP/IP, but it need not be.

A host TN3270E server refers to an implementation where the TN3270E server is collocated with the Systems Network Architecture (SNA) System Services Control Point (SSCP) for the dependent Secondary Logical Units (SLUs) that the server makes available to its clients for connecting into a SNA network. A gateway TN3270E server resides on an SNA node other than an SSCP, either an SNA type 2.0 node, a boundary-function-attached type 2.1 node, or an APPN node acting in the role of a Dependent LU Requester (DLUR). Host and gateway TN3270E server implementations typically differ greatly as to their internal implementation and system definition (SYSDEF) methods.

It is the intent that the MIB defined herein be extended by subsequent memos. For example, one such extension enables collection of TN3270E response time data.

1.0 Introduction

This document is a product of the TN3270E Working Group. Its purpose is to define a MIB module for support by a TCP/IP implementation for configuration and management of TN3270E servers.

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in RFC 2119, reference [22].

2.0 The SNMP Network Management Framework

The SNMP Management Framework presently consists of five major components:

- o An overall architecture, described in RFC 2271 [1].
- o Mechanisms for describing and naming objects and events for the purpose of management. The first version of this Structure of Management Information (SMI) is called SMIV1 and described in STD 16, RFC 1155 [2], STD 16, RFC 1212 [3] and RFC 1215 [4]. The second version, called SMIV2, is described in RFC 1902 [5], RFC 1903 [6] and RFC 1904 [7].
- o Message protocols for transferring management information. The first version of the SNMP message protocol is called SNMPv1 and described in STD 15, RFC 1157 [8]. A second version of the SNMP message protocol, which is not an Internet standards track protocol, is called SNMPv2c and described in RFC 1901 [9] and RFC 1906 [10]. The third version of the message protocol is called SNMPv3 and described in RFC 1906 [10], RFC 2272 [11] and RFC 2274 [12].
- o Protocol operations for accessing management information. The first set of protocol operations and associated PDU formats is described in STD 15, RFC 1157 [8]. A second set of protocol operations and associated PDU formats is described in RFC 1905 [13].
- o A set of fundamental applications described in RFC 2273 [14] and the view-based access control mechanism described in RFC 2275 [15].

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. Objects in the MIB are defined using the mechanisms defined in the SMI.

This memo specifies a MIB module that is compliant to the SMIV2. A MIB conforming to the SMIV1 can be produced through the appropriate translations. The resulting translated MIB must be semantically equivalent, except where objects or events are omitted because no translation is possible (use of Counter64). Some machine readable information in SMIV2 will be converted into textual descriptions in SMIV1 during the translation process. However, this loss of machine readable information is not considered to change the semantics of the MIB.

3.0 Structure of the MIB

The TN3270E-MIB is split into the following components:

- o TN3270E Server Control
- o TN3270E Server Resource Configuration
- o Resource/Client Address Mappings

There are three additional sections to address:

- o Advisory Spin Lock Usage
- o Row Persistence
- o IANA Considerations

The TN3270E-MIB is defined primarily for TN3270E servers. This memo does not explicitly address use of the MIB by TN3270 servers that do not support the TN3270E protocol. Even though a significant number of the objects in the MIB do apply in the TN3270-only case, the case was not addressed, since it is unlikely that a TN3270-only server would implement this MIB.

The SYSAPPL-MIB, reference [24], contains the Utf8String textual convention (TC) that the TN3270E-MIB imports. This TC, which is used for some MIB objects containing textual information, enables internationalization of text strings, whereas the DisplayString TC does not. The SNMP-FRAMEWORK-MIB, reference [1], contains the SnmpAdminString TC that the TN3270E-MIB also imports. Like the Utf8String TC, this TC also enables internationalization of text strings; in addition, it provides some guidelines on the length and content of the strings.

It is important to note that implementation of the SYSAPPL-MIB is not actually a prerequisite for implementing the TN3270E-MIB. On the other hand, implementation of the TN3270E-MIB does not preclude implementing the SYSAPPL-MIB as well. When both MIBs are implemented, the primary index into most of the TN3270E-MIB tables, tn3270eSrvrConfIndex, SHOULD equal one of the SYSAPPL-MIB's sysApplElmtRunIndex values. In this case the entry in the sysApplElmtRunTable provides additional information on a TN3270E server.

The MIB defined by this memo supports use of both IPv4 and IPv6 addressing. Two textual conventions, IANATn3270eAddrType and Tn3270eAddress, are defined for this purpose. IANATn3270eAddress is essentially equivalent to the TAddress TC, defined by RFC 1903. The difference between the two is that IANATn3270eAddress allows a zero-length octet string, while TAddress doesn't. It is important that IANATn3270eAddress allow for the absence of an address, because some

objects with this syntax are used as table indexes, and have special meanings when they contain zero-length strings.

The IANATn3270eAddrType textual convention is used rather than the TDomain TC (defined by RFC 1903) for identifying the contents of a tn3270eTAddress object. TDomain uses an OID to characterize the contents of an associated TAddress object. IANATn3270eAddrType was chosen over TDomain because, with a SYNTAX of Unsigned32 (enumeration type), it is much simpler to use as a component in an instance identifier. It was placed in the IANA-administered module to allow for the addition of values to cover cases (such as proxy servers) not covered by the TN3270E-MIB itself.

3.1 TN3270E Server Control

This group of objects provides for TN3270E server configuration and control. It consists of three tables:

- o tn3270eSrvrConfTable
- o tn3270eSrvrPortTable
- o tn3270eSrvrStatsTable

The tn3270eSrvrConfTable is the primary table within the entire TN3270E-MIB. As section 3.1.1 indicates, each TN3270E server is represented by an entry in this table, indexed by tn3270eSrvrConfIndex. Most of the other tables defined by the TN3270E-MIB have tn3270eSrvrConfIndex as their primary index. Entries in these tables MUST NOT exist for a TN3270E server when it does not have a tn3270eSrvrConfigEntry.

3.1.1 tn3270eSrvrConfTable

The tn3270eSrvrConfTable contains a set of objects primarily used for configuring and managing TN3270E servers. As with most of the other tables in the TN3270E-MIB, this table is indexed by an unsigned integer, tn3270eSrvrConfIndex. This primary index element enables support of multiple TN3270E servers by a single SNMP agent. Within the set of MIB objects returned by one SNMP agent, tn3270eSrvrConfIndex values MUST be unique, and need not be contiguous.

The tn3270eSrvrConfInactivityTimer object defines the inactivity period for user traffic on TN3270 and TN3270E sessions.

The four objects:

- o tn3270eSrvrConfConnectivityChk
- o tn3270eSrvrConfTmNopInterval
- o tn3270eSrvrConfTmNopInactTime
- o tn3270eSrvrConfTmTimeout

define the parameters for performing the "Telnet Timing Mark Option" as defined by RFC 860 [17]. The object tn3270eSrvrConfConnectivityChk allows a Management Station to select either a NOP command or a TIMING-MARK command. Sending a NOP command results in less overhead than a TIMING-MARK command, since a client doesn't send a reply.

The objects tn3270eSrvrConfAdminStatus and tn3270eSrvrConfOperStatus enable remote starting and stopping of a TN3270E server, and report the current state of the server. The object tn3270eSrvrConfFunctionsSupported indicates which of the TN3270 and TN3270E options a server supports. The object tn3270eSrvrConfSessionTermState defines as a TN3270E server-wide option what SHOULD occur when the SNA portion of a TN3270 or TN3270E session terminates with respect to the associated TCP connection. The object tn3270eSrvrConfSrvrType indicates whether the TN3270E server represented by a tn3270eSrvrConfEntry is a host or a gateway server. The object tn3270eSrvrConfContact provides a scratch pad area for a TN3270E server administrator to store information for later retrieval. The object tn3270eSrvrConfLastActTime reports the DateAndTime when the server was most recently activated. The special value of all '00'Hs indicates that the server has never been active.

The object tn3270eSrvrConfRowStatus provides the capability to perform row creation and deletion operations on this table.

3.1.2 tn3270eSrvrPortTable

The tn3270eSrvrPortTable represents the local TCP ports associated with a TN3270E server. This information is important because some TN3270E server implementations support usage of multiple local ports. A tn3270eSrvrPortEntry is indexed by:

- o tn3270eSrvrConfIndex
- o tn3270eSrvrConfPort
- o tn3270eSrvrConfPortAddrType
- o tn3270eSrvrConfPortAddress

Certain TN3270E server implementations restrict a local TCP port to a particular local IP address, instead of allowing connections for any local IP address to occur via the port. tn3270eSrvrConfPortAddrType

and tn3270eSrvrConfPortAddress allow this restriction to be represented in the MIB. A TN3270E server that doesn't restrict connections over a port to a local IP Address SHALL use the value unknown(0) for tn3270eSrvrConfPortAddrType, and a zero-length octet string for tn3270eSrvrConfPortAddress.

3.1.3 tn3270eSrvrStatsTable

The tn3270eSrvrStatsTable defines a series of objects that provide general usage statistics for a TN3270E server. An entry can represent the total activity for a server, or it can represent the activity occurring at the server on either a port or a port-and-local-address basis.

An implementation of this table MUST use only one of the three levels of refinement that the indexing of this table supports for the entries associated with a single TN3270E server.

The objects in this table reporting maximum, in-use, and spare LUs for terminals and printers presuppose an implementation where terminal resources and printer resources come from disjoint, dedicated pools. An implementation where resources for the two types of LUs come from a single shared pool should return the following values:

- o maximum: maximum size of the shared pool
- o in-use: number currently in use as this type of LU
- o spare: maximum - (terminal in-use + printer in-use)

3.2 TN3270E Server Resource Configuration

The following three tables provide for configuration of resources at a TN3270E server:

- o tn3270eClientGroupTable
- o tn3270eResPoolTable
- o tn3270eClientResMapTable

tn3270eClientGroupTable and tn3270eResPoolTable enable implementations to define groupings of both client addresses and resource pools for mapping client addresses to resources. The tn3270eClientResMapTable provides a mapping from a client group to a resource pool.

3.3 Resource Name / Client Address Mappings

The TN3270E-MIB contains three tables for mapping resource names to client addresses, and client addresses to resource names:

- o tn3270eSnaMapTable
- o tn3270eResMapTable
- o tn3270eTcpConnTable

3.3.1 tn3270eSnaMapTable

The tn3270eSnaMapTable is a read-only table that maps a secondary LU's SNA network name to the name by which it is known locally at the TN3270E server. For correlation with data from the SNA network, the name of the associated primary LU also appears in a tn3270eSnaMapEntry. An entry in this table is created when the Activate LU (ACTLU) request carrying the SNA network name of the SLU is received from the SSCP. The entry is deleted when the SLU is deactivated.

A TN3270E server provides a client with access to an SNA application by associating a TCP connection from the client with an SNA secondary LU (SLU) at the server. This SLU in turn has an SNA session with a primary LU (PLU) running on an SNA host. This PLU represents the application with which the client is communicating. The TN3270E-MIB includes two tables for mapping back and forth among the SNA name identifying the PLU, the SNA name identifying the SLU, and the TCP connection with the client.

In order to understand how these name mappings work, it is necessary to understand a subtlety involving the names of the SLUs at the TN3270E server: these names are often different from the names by which the SLUs are known in the rest of the SNA network. In the TN3270E-MIB, these two types of SLU names are termed "local names" and "SSCP-supplied names"; the latter term indicates that the name by which the SLU is known in the SNA network comes to the TN3270E server from the SNA System Services Control Point.

SSCPs don't always send SLU names down to secondary LUs; in some cases this capability must be turned on. In the case of SLUs served by a Dependent LU Requester (DLUR), an SSCP always sends SLU names to the DLUR. It is necessary, however, to enable the DLUR's PU/LU Network Name Forwarding function, so that it forwards the SLU names it receives from the SSCP down to the PUs that it serves.

For SLUs associated with an SNA type 2.0 node (or with a boundary-function-attached type 2.1 node) not served by a DLUR, inclusion of SLU names on ACTLU must be enabled explicitly at the SSCP via local configuration.

3.3.2 tn3270eResMapTable

The tn3270eResMapTable is a read-only table that maps a resource name to a client's address. An entry in this table is created when a TCP connection is received by a TN3270E server and mapped to a resource. The entry is deleted when the resource-to-address association is no longer valid.

3.3.3 tn3270eTcpConnTable

The TCP Connection Table is currently defined by RFC 2012 (Refer to reference [20], TCP-MIB Definitions). It contains the following objects:

- o tcpConnState (INTEGER)
- o tcpConnLocalAddress (IpAddress)
- o tcpConnLocalPort (INTEGER)
- o tcpConnRemAddress (IpAddress)
- o tcpConnRemPort (INTEGER)

It is indexed by: tcpConnLocalAddress, tcpConnLocalPort, tcpConnRemAddress, and tcpConnRemPort.

The tn3270eTcpConnTable contains objects for keeping a list of the current set of TN3270 and TN3270E sessions at a TN3270E server. The relationship between the tcpConnTable and the Tn3270eTcpConnTable is not one-to-one, since the tn3270eTcpConnTable contains information pertaining only to TN3270(E) sessions.

The tn3270eTcpConnTable has a different indexing structure from that of the tcpConnTable. Instead of using IpAddress objects, Tn3270eAddress and IANATn3270eAddrType object pairs are used to specify client addresses (both local and remote). This enables support of IPv6 addresses. In addition, the remote address pair precedes the local address pair in the index clause, in order to enable a GET-NEXT operation using only the remote address pair.

3.4 Advisory Spin Lock Usage

Within the TN3270E-MIB, tn3270eConfSpinLock is defined as an advisory lock that allows cooperating TN3270E-MIB applications to coordinate their use of the tn3270eSrvrConfTable, the tn3270eSrvrPortTable, the tn3270eClientGroupTable, the tn3270eResPoolTable, and the

tn3270eClientResMapTable. When creating a new entry or altering an existing entry in any of these tables, an application SHOULD make use of tn3270eConfSpinLock to serialize application changes or additions. Since this is an advisory lock, its use by management applications SHALL NOT be enforced by agents. Agents MUST, however, implement the tn3270eConfSpinLock object.

3.5 Row Persistence

The following tables enable remote creation of their entries by including RowStatus objects:

- o tn3270eSrvrConfTable
- o tn3270eSrvrPortTable
- o tn3270eClientGroupTable
- o tn3270eResPoolTable
- o tn3270eClientResMapTable

An implementation SHOULD NOT retain SNMP-created entries in these tables across reIPLs (Initial Program Loads) of the corresponding TN3270E server, since management applications need to see consistent behavior with respect to the persistence of the table entries that they create.

It is expected that local, implementation-dependent configuration information will be used to define the initial and persistent configurations for TN3270E server usage. Thus it is not necessary to enable persistence of table entries by adding StorageType (refer to RFC 1903 [6]) objects to these tables.

3.6 IANA Considerations

The tn3270eSrvrFunctionsSupported, tn3270eTcpConnFunctions, tn3270eTcpConnClientIdFormat, and tn3270eTcpConnLogInfo objects, as well as a number of objects identifying various address types, resource types, and device types, use textual conventions imported from the IANATn3270eTC-MIB. The purpose of defining these textual conventions in a separate MIB module is to allow additional values to be defined without having to issue a new version of this document. The Internet Assigned Numbers Authority (IANA) is responsible for the assignment of all Internet numbers, including various SNMP-related numbers; it will administer the values associated with these textual conventions.

The rules for additions or changes to the IANATn3270eTC-MIB are outlined in the DESCRIPTION clause associated with its MODULE-IDENTITY statement.

The current version of the IANATn3270eTC-MIB can be accessed from the IANA home page at: "<http://www.iana.org/>".

```

```
-- Textual Conventions
```

```
SnaResourceName ::= TEXTUAL-CONVENTION
```

```
    STATUS      current
```

```
    DESCRIPTION
```

```

        "The textual convention for defining an SNA resource
        name. A fully qualified SNA resource name, consisting
        of a 1 to 8 character network identifier (NetId), a
        period ('.'), and a 1 to 8 character resource name
        (ResName).

```

```

        The NetId and ResName are constructed from the
        uppercase letters 'A' - 'Z' and the numerics '0' - '9',
        all encoded in ASCII, with the restriction that the
        first character of each must be a letter.  Blanks are
        not allowed.

```

```

        Earlier versions of SNA permitted three additional
        characters in NetIds and ResNames:  '#', '@', and '$'.
        While this use of these characters has been retired,
        a Management Station should still accept them for
        backward compatibility.

```

```

        Note: This Textual Convention is not subject to
        internationalization, and does not use the character
        encodings used by the Utf8String Textual Convention."

```

```
Tn3270eTraceData ::= TEXTUAL-CONVENTION
```

```
    STATUS      current
```

```
    DESCRIPTION
```

```

        "An octet string representing trace data from the
        Telnet half of a TN3270E session, from the SNA half,
        or from both.  The octet string contains a sequence
        of trace elements, with the trace elements in the
        string ordered from earliest to latest.

```

```
Each trace element has the following form:
```

```

+---+---+---+-----+
!length !type!data      !
+---+---+---+-----+

```

where:

length = two-octet length of the data portion of the trace element, not including the length and type octets

type = one-octet code point characterizing the data; defined values are:

X'01' telnet PDU from the server to the client
 X'02' telnet PDU from the client to the server
 X'03' SNA data from the server to the SNA host
 X'04' SNA data from the SNA host to the server

data = initial part of a PDU.

It is implementation-dependent where the 'initial part of a PDU' starts. For SNA data, however, the starting point SHOULD be the first byte of the TH. For IP data the starting point SHOULD be the first byte of the IP header.

It is left to implementations to determine how much of each PDU to return in a trace element.

The zero-length string indicates that no trace data is available."

                                up(1),
                                down(2),
                                stopImmediate(3)
                        }
```

```
MAX-ACCESS  read-create
```

```
STATUS      current
```

```
DESCRIPTION
```

"The desired state of the TN3270E server represented by this entry in the table:

```
up(1)          - Activate this TN3270E server.
down(2)         - Informs the associated TN3270E
                  server to gracefully terminate
                  its processing.
stopImmediate(3) - Informs the associated TN3270E
                  server to terminate itself
                  immediately.
```

When a managed system creates an entry in this table, tn3270eSrvrConfAdminStatus and tn3270eSrvrConfOperStatus are initialized as up(1) by default.

The exact behavior of a server in response to a down(2) or stopImmediate(3) command is left implementation-

dependent. A TN3270E server that is capable of it SHOULD close all of its TN3270 and TN3270E sessions during a graceful termination.

Often the function enabled via stopImmediate(3) is used as a last resort by a system administrator, to attempt to either bring down a hung TN3270E server or free up its resources immediately to aid in general system availability, or to shut down a TN3270E server that is not recognizing a down(2) request.

A TN3270E server that does not distinguish between down(2) or stopImmediate(3) transitions should not support stopImmediate(3)."

```

    shuttingDown(4)
}
```

MAX-ACCESS read-only

STATUS current

DESCRIPTION

"The current operational state of a TN3270E server.
The following values are defined:

- up(1) - the server is active and accepting new client connections
- down(2) - the server is not active
- busy(3) - the server is active, but is not accepting new client connections because it lacks the resources to do so
- shuttingDown(4) - the server is active, but is not accepting new client connections because it is in the process of performing a graceful shutdown."

```
DEFVAL { up }
::= { tn3270eSrvrConfEntry 8 }
```

tn3270eSrvrConfSessionTermState OBJECT-TYPE

```
SYNTAX  INTEGER {
    terminate(1),
    luSessionPend(2),
```

```

        queueSession(3)
    }
MAX-ACCESS    read-create
STATUS        current
DESCRIPTION
    "This object determines what a TN3270E server
    should do when a TN3270 Session terminates:
    terminate(1)    => Terminate the TCP connection.
    luSessionPend(2) => Do not drop the TCP connection
                        associated with a client when its
                        TN3270 session ends. Processing
                        should redrive session initialization
                        as if the client were first connecting.
    queueSession(3) => This value relates to the Close
                        Destination PASS (CLSDST PASS) operation
                        in VTAM. An example provides the
                        easiest explanation. Suppose a TN3270E
                        client is in session with APPL1, and
                        APPL1 does a CLSDST PASS of the client's
                        session to APPL2. queueSession(3)
                        specifies that the TN3270E server must
                        keep the TCP connection with the client
                        active after it receives the UNBIND from
                        APPL1, waiting for the BIND from APPL2."

                    }
MAX-ACCESS    read-only
STATUS        current
DESCRIPTION
    "This object indicates the type of TN3270E server.
    The existence of MIB tables and objects that will be
    defined by follow-on MIBs may be predicated on whether
    the TN3270E server can be local to the same host as a
    target application (host(1)) or will always be remote
    (gateway(2)).

    A host TN3270E server refers to an implementation where
    the TN3270E server is collocated with the Systems
    Network Architecture (SNA) System Services Control Point
    (SSCP) for the dependent Secondary Logical Units (SLUs)
    that the server makes available to its clients for
    connecting into an SNA network.

```

A gateway TN3270E server resides on an SNA node other than an SSCP, either an SNA type 2.0 node or an APPN node acting in the role of a Dependent LU Requester (DLUR).

Host and gateway TN3270E server implementations typically differ greatly as to their internal implementation and system definition (SYSDEF) requirements."

tn3270eSrvrConfRowStatus OBJECT-TYPE

SYNTAX RowStatus

MAX-ACCESS read-create

STATUS current

DESCRIPTION

"This object allows entries to be created and deleted in the tn3270eSrvrConfTable. Entries may also be created and deleted as a result of implementation-dependent operations."

With the exception of tn3270eSrvrConfSrvrType, which an implementation can easily fill in for itself, all the columnar objects in this table have DEFVALs associated with them. Consequently, a Management Station can create a conceptual row via a SET operation that specifies a value only for this object.

When a tn3270eSrvrConfEntry is deleted (by setting this object to destroy(6)), this has the side-effect of removing all the associated entries (i.e., those having the same tn3270eSrvrConfIndex) from the tn3270eSrvrPortTable, the tn3270eSrvrStatsTable, the tn3270eClientGroupTable, the tn3270eResPoolTable, the tn3270eSnaMapTable, the tn3270eClientResMapTable, and the tn3270eResMapTable. All entries in the tn3270eTcpConnTable that belong to a TN3270E server that has been deleted MUST also be removed.

In other words, a tn3270eSrvrConfEntry must exist for a TN3270E server in order for it to have entries in any of the other tables defined by this MIB."

tn3270eSrvrStatsEntry OBJECT-TYPE

SYNTAX Tn3270eSrvrStatsEntry

MAX-ACCESS not-accessible

STATUS current

DESCRIPTION

"A collection of statistical and maximum usage objects for a single TN3270 server. An entry can represent the total activity of the server, or it can represent the activity occurring at the server on either a port or a port-and-local-address basis.

Collection of the statistics represented by the objects in this table is not mandatory. An implementation of this table MUST use only one of the three levels of refinement that this table supports for the entries associated with each TN3270E server.

The indexing for a row that represents total server statistics is as follows:

tn3270eSrvrConfIndex	value identifying the server
tn3270eSrvrPort	0
tn3270eSrvrPortAddrType	unknown(0)
tn3270eSrvrPortAddress	zero-length octet string.

On a port basis:

tn3270eSrvrConfIndex	value identifying the server
tn3270eSrvrPort	> 0
tn3270eSrvrPortAddrType	unknown(0)
tn3270eSrvrPortAddress	zero-length octet string.

On a port-and-local-address basis:

tn3270eSrvrConfIndex	value identifying the server
tn3270eSrvrPort	> 0
tn3270eSrvrPortAddrType	valid value other than unknown(0)
tn3270eSrvrPortAddress	non-zero-length octet string.

::= { tn3270eSnaMapEntry 3 }

tn3270eClientResMapTable OBJECT-TYPE

SYNTAX SEQUENCE OF Tn3270eClientResMapEntry

MAX-ACCESS not-accessible

STATUS current

DESCRIPTION

"This table defines resource-pool to client-group mappings. Since both the resource pool name and client group name are included in the index clause of this table, multiple resource pools can be assigned to the same client group. This enables use of multiple resource pools for use in client to resource mapping. Assigning multiple client groups to the same resource pool is also allowed, but is not the primary purpose for how the indexing is structured.

Assignment of a resource pool to client group can be restricted based on TCP port. An index value of 0 for tn3270eClientResMapClientPort disables restriction of resource assignment based on client target port selection.

No entry in this table shall exist without a corresponding (same tn3270eSrvrConfIndex) entry in the tn3270eSrvrConfTable existing.

An implementation SHOULD NOT retain SNMP-created entries in this table across re-IPLs (Initial Program Loads) of the corresponding TN3270E server."

```
OBJECTS {
    tn3270eSrvrStatsHCInOctets,
    tn3270eSrvrStatsHCOctets
}
```

STATUS current

DESCRIPTION

"Support of these objects is REQUIRED when the Counter32 versions can potentially wrap too frequently. This group is optional for all other hosts supporting the TN3270E-MIB.

The IF-MIB (RFC 2233) requires that the 64-bit versions of its counters be implemented when an interface can support rates of around 20 million bits per second or greater. This implies a minimum wrap rate of just over 28 minutes. It is recommended that this same guideline be used for determining whether an implementation implements these objects.

This group contains two objects with the syntax Counter64. An implementation that doesn't support these objects should return noSuchObject, since returning a zero is misleading."

::= { tn3270eGroups 4 }

END

5.0 Security Considerations

Certain management information defined in this MIB may be considered sensitive in some network environments. Therefore, authentication of received SNMP requests and controlled access to management information SHOULD be employed in such environments. An authentication protocol is defined in [12]. A protocol for access control is defined in [15].

Several objects in this MIB allow write access or provide for row creation. Allowing this support in a non-secure environment can have a negative effect on network operations. It is RECOMMENDED that implementers seriously consider whether set operations or row creation should be allowed without providing, at a minimum, authentication of request origin. It is RECOMMENDED that without such support, the following objects be implemented as read-only:

- o tn3270eSrvrConfInactivityTimeout
- o tn3270eSrvrConfConnectivityChk
- o tn3270eSrvrConfActivityTimeout
- o tn3270eSrvrConfActivityInterval
- o tn3270eSrvrConfAdminStatus
- o tn3270eSrvrConfSessionTermState
- o tn3270eSrvrConfContact
- o tn3270eClientGroupSubnetMask
- o tn3270eResPoolElementType
- o tn3270eSrvrConfRowStatus
- o tn3270eSrvrPortRowStatus
- o tn3270eClientGroupRowStatus
- o tn3270eResPoolRowStatus
- o tn3270eResMapRowStatus

For all tables in the MIB except the tn3270eTcpConnTable, the first index identifies an individual TN3270E server. This makes it easy to implement an access control policy under which different principals have access to objects related to different servers. Implementation of such a policy is not possible for the entries in the tn3270eTcpConnTable.

6.0 Intellectual Property

The IETF takes no position regarding the validity or scope of any intellectual property or other rights that might be claimed to pertain to the implementation or use of the technology described in this document or the extent to which any license under such rights might or might not be available; neither does it represent that it has made any effort to identify any such rights. Information on the IETF's procedures with respect to rights in standards-track and standards-related documentation can be found in BCP-11. Copies of claims of rights made available for publication and any assurances of licenses to be made available, or the result of an attempt made to obtain a general license or permission for the use of such proprietary rights by implementers or users of this specification can be obtained from the IETF Secretariat.

The IETF invites any interested party to bring to its attention any copyrights, patents or patent applications, or other proprietary rights which may cover technology that may be required to practice this standard. Please address the information to the IETF Executive Director.

7.0 Acknowledgments
