

Address-Prefix-Based Outbound Route Filter for BGP-4

Status of This Memo

This document specifies an Internet standards track protocol for the Internet community, and requests discussion and suggestions for improvements. Please refer to the current edition of the "Internet Official Protocol Standards" (STD 1) for the standardization state and status of this protocol. Distribution of this memo is unlimited.

Abstract

This document defines a new Outbound Router Filter (ORF) type for BGP, termed "Address Prefix Outbound Route Filter", that can be used to perform address-prefix-based route filtering. This ORF-type supports prefix-length- or range-based matching, wild-card-based address prefix matching, as well as the exact address prefix matching for address families.

1. Introduction

The Outbound Route Filtering Capability defined in [BGP-ORF] provides a mechanism for a BGP speaker to send to its BGP peer a set of Outbound Route Filters (ORFs) that can be used by its peer to filter its outbound routing updates to the speaker.

This documents defines a new ORF-type for BGP, termed "Address Prefix Outbound Route Filter (Address Prefix ORF)", that can be used to perform address-prefix-based route filtering. The Address Prefix ORF supports prefix-length- or range-based matching, wild-card-based address prefix matching, as well as the exact address prefix matching for address families [BGP-MP].

2. Address Prefix ORF-Type

The Address Prefix ORF-Type allows one to express ORFs in terms of address prefixes. That is, it provides address-prefix-based route filtering, including prefix-length- or range-based matching, as well as wild-card address prefix matching.

Conceptually, an Address Prefix ORF entry consists of the fields <Sequence, Match, Length, Prefix, Minlen, Maxlen>.

The "Sequence" field specifies the relative ordering of the entry among all the Address Prefix ORF entries.

The "Match" field specifies whether this entry is "PERMIT" (value 0) or "DENY" (value 1).

The "Length" field indicates the length (in bits) of the address prefix. A length of zero indicates a prefix that matches all (as specified by the address family) addresses (with the prefix itself of zero octets).

The "Prefix" field contains an address prefix of an address family.

The "Minlen" field indicates the minimum prefix length (in bits) that is required for "matching". The field is considered unspecified with a value of 0.

The "Maxlen" field indicates the maximum prefix length (in bits) that is required for "matching". The field is considered unspecified with a value of 0.

The fields "Sequence", "Length", "Minlen", and "Maxlen" are all unsigned integers.

This document imposes the following requirement on the values of these fields:

$$0 \leq \text{Length} < \text{Minlen} \leq \text{Maxlen}$$

However, tests related to the "Minlen" or "Maxlen" value should be omitted when the "Minlen" or "Maxlen" field (respectively) is unspecified.

In addition, the "Maxlen" value must be no more than the maximum length (in bits) of a host address for a given address family [BGP-MP].

3. Address Prefix ORF Encoding

The value of the ORF-Type for the Address Prefix ORF-Type is 64.

An Address Prefix ORF entry is encoded as follows. The "Match" field of the entry is encoded in the "Match" field of the common part [BGP-ORF], and the remaining fields of the entry are encoded in the "Type specific part", as shown in Figure 1.

+-----+
Sequence (4 octets)
+-----+
Minlen (1 octet)
+-----+
Maxlen (1 octet)
+-----+
Length (1 octet)
+-----+
Prefix (variable length)
+-----+

Figure 1: Address Prefix ORF Encoding

Note that the "Prefix" field contains the address prefix followed by enough trailing bits to make the end of the field fall on an octet boundary. The value of the trailing bits is irrelevant.

4. Address Prefix ORF Matching

In addition to the general matching rules defined in [BGP-ORF], several Address-Prefix-ORF-specific matching rules are defined as follows.

Consider an Address Prefix ORF entry, and a route maintained by a BGP speaker with Network Layer Reachability Information (NLRI) in the form of <Prefix, Length>.

The route is considered as "no match" to the ORF entry if the NLRI is neither more specific than, nor equal to, the <Prefix, Length> fields of the ORF entry.

When the NLRI is either more specific than, or equal to, the <Prefix, Length> fields of the ORF entry, the route is considered as a match to the ORF entry only if the NLRI match condition as listed in Table 1 is satisfied.

ORF Entry		NLRI
Minlen	Maxlen	Match Condition
un-spec.	un-spec.	NLRI.length == ORF.length
specified	un-spec.	NLRI.length >= ORF.Minlen
un-spec.	specified	NLRI.length <= ORF.Maxlen
specified	specified	NLRI.length >= ORF.Minlen AND NLRI.length <= ORF.Maxlen

Table 1: Address Prefix ORF Matching

When more than one Address Prefix ORF entry matches the NLRI of the route, the "first-match" rule applies. That is, the ORF entry with the smallest sequence number (among all the matching ORF entries) is considered as the sole match, and it would determine whether the route should be advertised.

The assignment of the sequence numbers is a local matter for the BGP speaker that sends the Address Prefix ORF entries.

5. IANA Considerations

This document specifies a new Outbound Route Filtering (ORF) type, Address Prefix ORF. The value of the ORF-type is 64.

6. Security Considerations

This extension to BGP does not change the underlying security issues in [BGP-4].
